Imagine *Pointe*—an AI built for developers, quietly monitoring the project infrastructure for environmental drift. Now imagine *Lawrence*—a consumer-facing micro-task legal coach who turns confusing contracts into plain English. Or Quip—a voice-activated memory companion designed for people with ADHD, helping them stay organized, track tasks, and capture thoughts on the fly. With AI, we can build tools for anyone. The ideas are limitless.

I am looking for an opportunity that doesn't box in my creativity, but supercharges it.

My background supports that ambition. At Princeton University, I led a 7-week research project and presented my findings to the lab. I spent lunches learning from graduate students, one of whom was designing an artificial fish capable of navigating dynamic underwater environments. As he explained his obstacle-avoidance algorithm, something clicked. Ideas started flooding in. That moment—when innovation becomes contagious—is the kind of energy I thrive on and the kind of energy I hope to find at your company.

I've also interned at the University of Washington as a software developer on Project Sidewalk, a crowdsourced effort to improve sidewalk accessibility for people with disabilities. There, I developed the Git skills that have served me in countless projects since—and more importantly, I discovered a deep passion for building real solutions for real people.

Imagination and impact are the pillars for my work. I bring a unique blend of technical expertise, forward thinking, and entrepreneurial ambition to the table. Together, we can take bold ideas and turn them into tools that matter.

Sincerely,
Lindsey Ehrlich
